

The Likelihood of Human Casualty in Highway Crashes

Tenth Briefing: Proposed Research for 1996/1997

Based on an Investigation Conducted for
the FHWA/NHTSA Crash Analysis Center
at George Washington University, Virginia

September 24, 1996
DeBlois Associates, Washington, D.C.
Phone (202) 625-2637; FAX (202) 625-2639

"The Likelihood of Casualty in Highway Crashes"

Introduction

This tenth briefing concerning the cited subject addresses (a) proposed work for the 1996/1997 program; and (b) differences and difficulties encountered in the translation of injuries from the OIC, NASS pre-93, protocol to the AIS90, NASS post-92 protocol, and vice-versa.

Proposed Work for the 1996/1997 Program

Introduction -- Although started, the research necessary to translate advance notification data, about highway crashes, either from vehicle mounted sensors at crash time or from emergency attendants at the scene, needs much further work to reach the maturity necessary for applications in making intelligent and effective decisions concerning the needed type and extent of emergency care. The proposed project aims at advancing the state of the art of the cited research.

Objectives -- The objectives of the proposed project are to advance the state of the art in translating pertinent information concerning crash, vehicle(s), and occupant(s) into information needed by emergency centers and emergency physicians, in order to deliver appropriate and effective services to crash victims, thus minimizing human losses and costs.

Methods of Research -- The primary method of research will include analyses and evaluations of: (a) crash, vehicle, and occupant attributes that can be sensed and emitted at crash time, and are deemed pertinent and potentially useful to the purpose of the project; (b) cited attributes that are deemed observable by emergency attendants at the crash scene; (c) the partition of the entire injury population into groups with injury attribute profiles carrying given implications of needed emergency care; (d) the availability of data cited under items a, b, and c above in the NHTSA and other crash records; (e) the search for useful correlations between items b and a, or between c and a; (f) the development of programmable probabilistic algorithms through multiple iterative procedures; (g) the estimation of error bounds for the probabilities of given casualty as a function of stipulated values of predictors; and (h) an evaluation and ranking of projected usefulness, as a function of algorithm complexity and demand for crash data.

Specific Topics

The cited research framework will include as a minimum the following topics:

- (i) Search for algorithms of rollover casualties, given that the resolution so far for the occurrence of such casualties is rather poor.
- (ii) Deal with the imperfections of translating AIS90 to OIC codes and vice versa. This is important if pre-93 data

are to be incorporated in the analyses.

- (iii) Deal with the effects of "unknowns" in the NASS data concerning both predicted responses and predictors.
- (iv) Develop algorithms based on a partial list of available predictors. For example delta V may not always be available, even for planar crashes.
- (v) Develop logic diagrams and procedures leading to an appropriate algorithm, based on actually available predictors, from a list of potentially available predictors.
- (vi) Conduct a sensitivity analysis of the predictive abilities of an algorithm, as a function of algorithm structure.
- (vii) Address and evaluate algorithms for: car fire occurrence and occupant entrapment, events requiring the dispatch of special equipment.
- (viii) Provide coverage for earlier NASS data: 1988-1992 concerning compelling injuries; and 1979-1986 for any casualty.
- (ix) Address and evaluate potentially useful algorithms for injured people other than car occupants, e.g. occupants of light trucks and vans, motorcyclists, bicyclists, and pedestrians.

Data Sources -- Given the resolution needed in the cited topics and methodology, the primary source of data for the proposed project will be the NASS/CDS for the years 1988-1995 currently available, plus the years to become available as the proposed project progresses.

Data will be used also from those available in earlier NASS years (NASS/CSS 1979-1987), and in the NCSS (1977-1979) records. These additional data certainly provide variables with the resolution desired in all aspects of the proposed project. They may be somehow dated but offer significant advantages: (i) a very much needed expansion of sample sizes; (ii) inclusion of all, as opposed to towaway only, police reported crashes; and (iii) an enhanced perspective.

Schedule and Deliverables

The cited project can be executed in the year October 1, 1996 to September 30, 1997. Informal briefings will be delivered as requested by the sponsor. A draft final report will be prepared before August 15, 1997. A final report, incorporating all revisions, will be delivered before September 30, 1997.

Table I. Assignment of Compelling or Noncompelling Nature to a Car Occupant Injury, based on an AIS90 to OIC Protocol Translation in the NASS 1995 File
